INDIA'S FIRST 1320 nm Nd:YAG Laser for Varicose Veins

With The COOLTOUCH CTEV It's Easy To Be Free Of Varicose Veins

There is no reason to continue enduring the pain, discomfort and unsightly disfigurement that is often caused by varicose veins. Many people have put off treatment thinking they would have to face vein stripping, which is major surgery requiring hospitalization, general anesthesia and several weeks of recovery time.

Now there is no reason to postpone treatment. The CoolTouch CTEV 1320 nm offers a relatively pain-free, quick and highly successful treatment alternative that gets you back to your life quickly.

DON'T ACCEPT JUST any treatment FOR YOUR VARICOSE VEINS

Since the late 1990s, there have been several new therapies offered as an alternative to vein stripping for the treatment of varicose veins e.g. sclerotherapy, radiofrequency and endovenous lasers.

Endovenous Laser:

The newest technology available, this procedure uses light waves to eliminate varicose veins. Due to the technology used, end venous medical lasers are able to treat a large range of vein sizes.

Not all lasers are the same make sure you choose the CoolTouch CTEV 1320 nm.

There are several different endovenous lasers on the market today. The single most critical component that determines the overall success of endovenous laser treatment is the laser's wavelength.

The CoolTouch CTEV laser has a 1320 nm wavelength, which has been found to be the most comfortable and effective laser treatment for varicose veins.

The 1320nm wavelength requires less heat to close the vein than Diode lasers, which have an 810, 940 or 980 wavelength. The high heat generated by Diode lasers can actually rupture the vein causing significant pain, swelling and bruising. With the CoolTouch CTEV, you will receive the best results available. You will experience minimal, if any pain, bruising or post op complications and the success rate is greater than 95%.

Don't settle for less ask for the CoolTouch CTEV solution today!

Before

After

How Does The CoolTouch CTEV 1320 nm LASER WORK ?

With the CoolTouch CTEV, a small single needle incision is made in the leg and a fiber inserted into the varicose vein. The laser is activated and as the fiber is moved through the vein it gently heats and safely closes the vein. Once the vein is closed, the blood that was back circulating through this vein is simply rerouted to other healthy veins and the varicose vein essentially vanishes.

A Simple Office-Based Procedure

The CoolTouch CTEV procedure is minimally invasive. You are awake during the entire procedure, but you will feel very little if any pain, as your leg will be numbed using a local anesthetic. The procedure takes approximately one hour to perform per leg treated.

Cosmetically Pleasing Results

One of the tremendous benefits of the CoolTouch CTEV procedure is that patients do not experience the incision scars or bruising that are often present with alternative treatments. Rarely does bruising occur when the CoolTouch CTEV procedure is performed alone. And since the incision is so small, no stitches are necessary.

Rapid Relief from Symptoms

Your symptoms will begin to improve immediately after the CoolTouch CTEV procedure is completed. However, depending on their severity, some symptoms may take 1-2 weeks to disappear completely.

Quick Return To Work And Play

After the procedure, your leg will be wrapped in a compression bandage and you will be up and walking the same day. You will be able to resume light routine activity the next day and athletic or strenuous activities within a couple of weeks depending upon your specific case.

Why Choose The CoolTouch CTEV for Your Varicose Vein Treatment?

- Most comfortable laser procedure available
- Rapid relief of symptoms
- Relatively pain free
- No downtime
- Minimal, if any, scarring
- No general anesthesia
- Quick day care procedure
